Dan Kubin

EXPLANATION

- Speed measurement values are in Herzts [Hz], and it represents the number of punctures by the needle for each second.
- The voltage shown in the tables has been measured at the machine connector, so the influence of the cable is compensated.
- All the machines were loaded with a new needle during the test.
- The results of these tests have been obtained from genuine machines that were never used before. The same tests were made after 6 months of use and compared to the original results showing no change in performance.
- All tests have been carried out with a MUSOTOKU Machete MK-1 power supply with 5A of current capability.

DISCLAIMER

These tests have been made by an independent laboratory and personnel with no relationship with any of the manufacturers analyzed.

- It is not the purpose of this test to measure the quality of a model over the others, but only to learn the speed performance of each model.
- The realization of these tests has been made with sophisticated laboratory equipment under valid calibration and operated by qualified technicians. Therefore these test results are practical, not theoretical.
- The data shown in this study is experimental and has to be used as a guideline, and not as a manufacturer declaration of certified performance. Consult your manufacturer if you need further technical information about any of these models.
